MECHANISATIE & MACHINEBOUW

Quickfill series www.emmersvuljezo.nl

The QuickFill Belt uses a conveyor belt to move the containers towards the filling station. Flower containers of different sizes can be placed on the conveyor belt. The flower containers are then filled with a dosed amount of water, and if needed, flower food. After filling the container with water and flower food, the container is moved on the conveyor to the end of the machine. When this container is removed from the conveyor belt the machine will continue its process.
