

Quickfill series www.emmersvuljezo.nl

Are you looking for a compact, safe, easy to operate container/bucket filling machine?
With a competitive, friendly price? We offer you the QuickFill!

The EasyWater QuickFill is a semi-automatic, modernised upgrade of the well-known bucket-filler. It uses a linear motion with smart and simple construction details that makes it more compact and safer. Also, the QuickFill is easy to operate and available at a friendly price.

The QuickFill is equipped with a lift-platform that is attached to the machine by means of a safety system to prevent unsafe situations. Flower containers or buckets in all variations can easily be placed by sliding them (from 3 sides) on the lift-platform. Starting up the machine brings the upper container on an ergonomic working level. In addition, this container will be equipped with an adjustable amount of water and, if desired, add flower-food by a filling-pipe which turns above the container. After dosing the water, the filling-pipe returns to its neutral position, so that the flowers can be easily placed in the container. Then you can take away the upper container with the flowers in it to put it, for example, on a trolley. When the upper container is removed, the lift-platform automatically comes up to the ergonomic working level again. If the last container is taken off, the lift-platform descends quickly, so you can put the next pile of containers on it.

Advantages Quickfill

- Compact, safe and easy to operate.
- Ergonomic working-level.
- No dripping hose.
- Can be placed nearly anywhere.
- Friendly pricelevel.
- Maintenance free.

Characteristics QuickFill

- Uses a linear movement.
- Suitable for all kinds of containers/buckets.
- Containers can easily be slid from 3 sides on the platform.
- Lift-platform attached with safety equipment.
- Dosing-pump for adding cutflower food to the water.
- Equipped with a flowmeter.
- Made of stainless steel.
- 230 volt.

By the flattened edges of the feet and the lift-platform, the stacks can be slid easily on the machine, one doesn't need to lift the pile.

Filling-pipe comes above the containers during filling and then reverts back to his neutral position, this means no water droplets will fall on the flowers and you re not hampered when placing flowers in the container.
